

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

EXPERIMENT -2

Student Name: Aditya Kumar

Branch: BE-CSE

Semester: 5th

Subject Name: Salesforce-1

UID:24BCS10209

Section/Group:24BCS_KRG601A

Date of Performance:

Subject Code: 24CSH-316

EXPERIMENT 2.1

1. Aim: Task-2 Populate Data

Task

Write a query using union to stack the table 'Arts' over 'Science' and output the final table

Note:

The UNION statmente removes the duplicate data in the new table formed.

2. QUERY:

```
SELECT * FROM Arts
UNION
SELECT * FROM science
```

3. Output:

The screenshot shows a web-based SQL editor interface. The left pane displays a tutorial for the UNION operator, explaining that it stacks the results of two queries vertically. It provides an example query: `SELECT * FROM Mfg_Ind; UNION SELECT * FROM Mfg_Int;` and shows the resulting tables. The right pane shows the user's query: `SELECT * FROM Arts; UNION SELECT * FROM science;`. Below the query, the 'Your Output' section displays a table with two columns: 'Sub_id' and 'Sub_Name'. The table contains six rows of data: (108, Physics), (109, Chemistry), (110, Biology), (111, Economics), (112, History), and (113, Sociology). A green message at the bottom says 'Great job, keep it up!'. The interface includes navigation buttons like 'Prev', 'Next', 'Submit', and 'Next'.

Sub_id	Sub_Name
108	Physics
109	Chemistry
110	Biology
111	Economics
112	History
113	Sociology

EXPERIMENT 2.2

1. Aim:

Task

Write a query to output a single table with the names of employees in both the table 'employee' and 'pt_employee'. Employee names are added on the field emp_name in both the tables.

Note: Do not remove the duplicate names while combining both the tables.

2. QUERY:

```
SELECT emp_name FROM Employee
UNION ALL
SELECT emp_name FROM pt_employee;
```

EXPERIMENT 2.3

3. Aim: Task

Consider a supermarket database

Table 'fruit' has the list of all fruits available in the market(few of them could be out of stock).

Table 'inventory' has the updated list of items in the supermarket.

Write a query to find the list of fruits available in the supermarket.

(f_name column has the name of the fruits and inv_name has the name of the items in the inventory, you are suppose to output the name of the fruits.)

4. QUERY:

```
SELECT f_name From fruit
INTERSECT
SELECT inv_name FROM inventory
```

5. Output:

The screenshot shows a web browser displaying a CodeChef problem page. The page title is 'codechef.com/learn/course/sql/intermediate/SQ008506/problems/GSQ767tab: statement'. The problem is titled 'Statement' and 'Submissions'. The task description is as follows:

Task

Consider a supermarket database

- Table 'fruit' has the list of all fruits available in the market(few of them could be out of stock).
- Table 'inventory' has the updated list of items in the supermarket.

Write a query to find the list of fruits available in the supermarket. (f_name column has the name of the fruits and inv_name has the name of the items in the inventory, you are suppose to output the name of the fruits.)

Expected output

f_name
Banana
Cherry
Grape
Kiwi
Pear
Pineapple
Watermelon

The query is shown in the 'Statement' tab:

```
INTERSECT
SELECT f_name FROM fruit
INTERSECT
SELECT inv_name FROM inventory
```

The 'Your Output' section shows the expected output table:

f_name
Banana
Cherry
Grape
Kiwi
Pear
Pineapple
Watermelon

A green message box says 'You got it right!'. The 'submit' button is visible.

EXPERIMENT 2.4

1. Aim: Task

Consider the same supermarket database we used in the previous problem.

Write a query to output the name of the fruits (f_name) from the table 'fruit' which are not present in the table inventory.

f_name column has the name of the fruits and inv_name has the name of the items in inventory.

2. QUERY:

```
SELECT f_name FROM fruit
EXCEPT
SELECT inv_name FROM inventory;
```

3. Output:

The screenshot shows a web browser window displaying a CodeChef problem page. The URL is [codechef.com/learn/course/sql-intermediate/SQ008S06/problems/GSQ77](https://www.codechef.com/learn/course/sql-intermediate/SQ008S06/problems/GSQ77). The page has tabs for Statement, Submissions, Solution, and AI Help. The 'Statement' tab is active, showing the problem description and the task. The task asks to write a query to output the name of the fruits (f_name) from the table 'fruit' which are not present in the table inventory. The expected output is shown as a table with f_name values: Apple, Mango, and Orange. The SQL query is entered in the editor, and the output is displayed as a table with f_name values: Apple, Mango, and Orange. A green checkmark and the message 'Awesome, you nailed it!' are shown below the output table. The 'Submit' and 'Next' buttons are at the bottom right.

Except

Previously we learned the concept of **INTERSECT**, now lets see how **EXCEPT** works. **EXCEPT** is directly opposite to that of **INTERSECT**. **EXCEPT** retrieves unique records from the first **SELECT** statement that are not present in the output of the second **SELECT** statement.

Below is the format for the same:

```
SELECT * FROM table_1
EXCEPT
SELECT * FROM table_2;
```

Task

Consider the same supermarket database we used in the previous problem. Write a query to output the name of the fruits (f_name) from the table 'fruit' which are not present in the table inventory. f_name column has the name of the fruits and inv_name has the name of the items in inventory.

Expected output

f_name
Apple
Mango
Orange

SQL

```
7
8
9
10
11
12
13
14
15 SELECT f_name FROM fruit
16 EXCEPT
17 SELECT inv_name FROM inventory;
```

Your Output

f_name
Apple
Mango
Orange

✓ Awesome, you nailed it!

Submit **Next**

4. Learning Outcome:

- Understand how to use the `INSERT INTO` statement to populate tables with data.
- Insert multiple records into database tables while maintaining data accuracy.
- Follow the correct table names, field names, and data formats during insertion.
- Retrieve records from database tables using the `SELECT` statement.
- Use the `LIMIT` (or equivalent) clause to fetch the first record from a table.
